**AFTER CARE INFORMATION FOLLOWING ENDODONTIC  
(Root Canal) TREATMENT**

- Endodontic treatment can take 1, 2 or 3 appointments depending on each case. It is possible to experience any of the following symptoms after any one of these appointments: sensitivity to hot and/or cold; sensitivity to pressure; possible swelling.**
- It is difficult to predict which symptoms, if any, you may experience and to what extent. In complicated cases, pain medication may be necessary.**
- If you are experiencing swelling, it may be necessary to prescribe an antibiotic for you.**
- A temporary filling may be used to seal the tooth between visits.**
- Be gentle on the tooth while eating until the final restoration is placed.**
- During endodontic treatment the nerve, blood and nutrient supply to the tooth is removed. This will cause the tooth to become brittle and prone to fracturing, which can result in the need to extract the tooth. In many cases a full coverage crown restoration (cap) and post may be recommended to prevent this from happening.**
